

ONLINE WEBINAR

A self-defending Operational Technology (OT) in manufacturing and industry

Friday
3 Nov
2023
11H00-12H00

In this one-hour webinar, we will explore the essential domain of Operational Technology (OT) security, a field gaining prominence due to the increasing integration of digital technology into critical infrastructures such as energy production and manufacturing. While traditional Information Technology (IT) security is well-discussed, the specific challenges posed by OT systems—often essential for public welfare—require focused attention.

Through this session, we aim to provide a nuanced understanding of risk assessments, illustrate the unique aspects of OT versus IT security, and offer concrete mitigation strategies. By integrating real-world case studies, the webinar seeks to provide attendees with a balanced view and actionable insights to enhance the security posture of their respective OT environments.
